Lumos LSX Rail Features...

Hidden

While conventional rails must extend out to the edge of the last solar module in each row of your solar array, the Lumos LSX rails only run to the last attachment point, almost 3 inches inside the outer edge of the panel.

Precision

The LSX Rails mount to the underside of the Lumos LSX solar modules using a through-bolt mounting system. This means each LSX solar module can be installed & removed without disturbing the modules on either side. Modules are also within 1/4" of each other, which create a tight, consistent appearance. The gap between solar modules can be waterproof-sealed if desired.

Integrated

The LSX Rail system includes an integrated wireway, which keep all module wiring off the roof, safe from exposure, and concealed.

Strength

LSX Rails are built strong to handle almost any solar module configuration desired. 6005AT5 Aluminum. Complete engineering specs are available for calculating spans & cantilever distances for an installation that lasts.

Beauty

Although they are hidden under the solar modules, LSX rails feature a tough PPG Duracron finish in black so they remain inconspicuous for years
